

**Final Analysis:**

Among the three product categories skincare generated the most profit at approximately \$239k with haircare at second with \$172k and cosmetics trailing at \$160k. What products can do to better up their profits is better quality checks. Better quality checks means less defective products with will lead to greater profits. Haircare has the highest defective rate at 2.483, skincare has the second highest defective rate at 2.335, and cosmetics have the third highest defective rate at 1.919. Higher defect rates may lead to additional costs of returns and rework. To estimate the impact of this issue I calculated the profit exposures using the estimated profit and defect rate resulting in results like skincare products end up losing about \$5590, haircare losing about \$4286, and cosmetics losing about \$3075. Overall, the analysis suggests that improving quality control by reducing defect rates may help with profitability.
